ADVANTAGE OF FOAM

Contact time maximizes
chemistry's effectiveness

Visual marker for
equipment operator

Expansion rates reduce
water and chemical usage

Reduced labor costs

Foam-it Junior

FI-JR

The Foam-it Junior is powered by a 1.5HP air compressor that allows this unit to produce 10 gallons of foam per minute. The unique dual-tube technology receives chemical and air from the unit to create thick foam when mixed at the trigger wand. The foam line is 25' in length and can be customized to meet different applications. This unit also features an air needle valve adjustment to control the consistency of the foam. This unit allows for cleaning with quality foam where compressed air is not available.
