Smart Technology

No ball valve. No stored pressure.
Revolutionary control you won't find anywhere else.

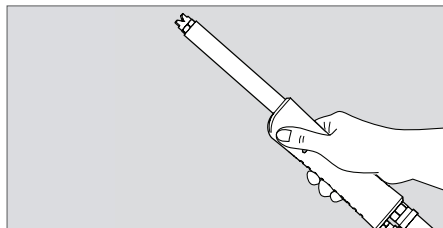

Smart units never store pressure. That makes them safer to store and maintain.

Smart units give you more control and flexibility than traditional units. You can hold the air trigger for steady foam output, or flutter it for lower volume, so you can foam surfaces close by or further away.

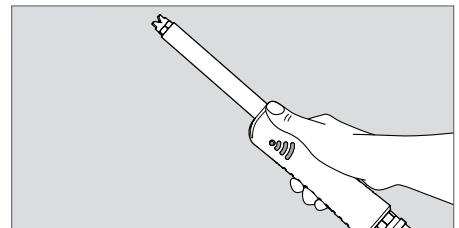

Smart units shut off automatically if air trigger is released, protecting user and surroundings from chemical exposure in the event of a fall or accident.

Smart handles are tough but lightweight. They are made of ultra high molecular weight polyethylene, which is a super-durable type of plastic.

HOW IT WORKS:

Cover the air trigger with your thumb or finger to start foaming.

Release the air trigger, and the unit will automatically shut off and depressurize.
